

# Topic Modeling

- Discover topics in a text corpus (a collection of documents)
- scikit-learn package is very popular in Python: <http://scikit-learn.org/stable/modules/generated/sklearn.decomposition.NMF.html>
- Gensim module is very popular in Python: <http://radimrehurek.com/gensim/>

## Algorithms

- Non-negative matrix factorization (NMF)
- Latent Dirichlet Allocation (LDA)

## 1. Non-Negative Matrix Factorization (NMF or NNMF)

- is a group of algorithms in multivariate analysis and linear algebra
- where a matrix  $V$  is factorized into (usually) two matrices  $W$  and  $H$ ,
- with the property that all three matrices have **no negative elements**.

This non-negativity makes the resulting matrices easier to inspect.

Also, in applications such as processing of audio spectrograms or muscular activity, non-negativity is inherent to the data being considered.

Since the problem is not exactly solvable in general, it is commonly approximated numerically.

Source: [https://en.wikipedia.org/wiki/Non-negative\\_matrix\\_factorization](https://en.wikipedia.org/wiki/Non-negative_matrix_factorization)
